

FIT BUDDY – AI FITNESS PLAN GENERATOR

Using Gemini Models

Project Overview

- Fit Buddy is an AI-based concept for generating structured fitness plans.
- The project combines generative AI capabilities with fitness-oriented planning.
- The goal is to produce clear, organized and useful plan content based on the user's requirements.
- Gemini is considered because of its multimodal capabilities for working with text, images and documents.

Activity 1.1: Research and Select the Appropriate Generative AI Model

Slide 1 — Introduction to Generative AI

- Generative AI is a type of artificial intelligence that can create new content.
- It can generate text, images, audio, video and computer code.
- Popular generative AI models include GPT, Gemini, Claude and Llama.
- The appropriate model depends on the task, accuracy, speed, cost and required output type.
- For Fit Buddy, generative AI can help organize fitness-plan content into a clear and user-friendly format.

Fit Buddy example: A user can provide fitness goals or requirements, and an AI model can generate structured plan content such as activities, explanations and supporting information.

Slide 2 — Researching Generative AI Models

Model	Main Strength	Suitable For
GPT	Text, reasoning, coding	Writing, research, coding
Gemini	Multimodal capabilities	Text, images, documents
Claude	Long-context text work	Analysis, summarization
Llama	Open-model ecosystem	Custom AI applications

Important selection factors

- Accuracy and reasoning ability
- Context length
- Multimodal support
- Response speed
- Cost
- Privacy and security
- Ease of integration

Slide 3 — Selecting the Appropriate Model

Project task: Create a detailed academic presentation and support the Fit Buddy concept with organized AI-generated content.

Requirements

- Understand the topic
- Generate organized content
- Summarize information
- Produce clear explanations
- Support images or other media when required

Selection process

- 1. Define the objective.
- 2. Identify the type of content required.
- 3. Compare available AI models.
- 4. Check accuracy and reliability.
- 5. Consider cost and accessibility.
- 6. Test the model with sample prompts.
- 7. Select the model that best matches the requirements.

Selected model: Gemini

For this Fit Buddy project, Gemini is the project-focused model because the source topic explicitly identifies Fit Buddy as an AI Fitness Plan Generator using Gemini Models. Its multimodal capability can support text, images and document-based project content.

Slide 4 — Fit Buddy: AI Fitness Plan Generator

- Input: User fitness requirements and relevant project information.
- AI processing: The generative AI model interprets the request and organizes the required content.
- Output: A structured fitness-plan response that is easy to understand and present.
- Supporting content: Text, images or documents can be incorporated when required.
- Project benefit: Helps present fitness-plan information in an organized and accessible format.

Important: AI-generated fitness information should be treated as informational content; individual exercise or health decisions may require guidance from a qualified professional.

Slide 5 — Conclusion

- Generative AI models have different strengths and capabilities.
- There is no single model that is best for every task.
- Model selection should be based on the specific requirements of the project.
- Testing models with sample prompts can help identify the model that matches the project requirements.
- For the Fit Buddy project, Gemini provides a relevant multimodal foundation for generating organized content.
- Key takeaway: Choose the AI model based on task requirements, output quality, cost, speed and security.

“The appropriate generative AI model is the one that best matches the goal, data, constraints and expected output of the task.”
